

TooLOK

“Touch three and you’ll see” that TooLOK™ is the easiest inspection system ever. Exclusively from ROMER, TooLOK is the newest of our Arm Tracker Products and increases your throughput by automating the inspection of tools, fixtures and parts.

By contacting three pre-qualified points on a part, tool or fixture with the ROMER CMM probe, TooLOK launches and:

- recognizes the part
- aligns (references) the tool, fixture or part
- loads the CAD file and inspection routine
- tells the operator where to begin measuring

TooLOK is an advanced add-on utility for PowerINSPECT, our standard inspection and reverse-engineering software. PowerINSPECT allows for rapid inspection of complex 3D parts and generates CAD-to-part comparisons. TooLOK is 100% compatible with previously programmed PowerINSPECT inspection routines.

TooLOK eliminated confusion, saving you time and money: No more searching through hundreds of files and routines to get ready for inspection!

The simple-to-use TooLOK wizard allows users to generate a LOK for a fixture, gage, part or tool. The LOK then serves as the reference between the part and its associated files.

PowerINSPECT's programmed inspection routines ensure consistency between operators. Once the LOK is established, an inspection routine can easily be created, allowing other users to follow that routine and ensuring reliable measuring consistency.
